

Programming: Writing instructions for a computer so it knows what to do.

Boda example: You tell your passenger, “Hold tight, we are going to Wandegeya using this road.” Those instructions are like a program.

Relationship between CPU, RAM and Hard Disk

- **Hard Disk** = Your house or garage where you keep everything.
- **RAM** = The carrier or pocket where you keep things you’re using right now.
- **CPU** = Your brain that thinks and makes decisions.

In a computer:

- Files are stored on the **Hard Disk**.
- They are loaded into **RAM**.
- The **CPU** works on them.

Memory Address: The exact location where something is stored in memory.

Example:

Every house has a plot number. If someone says, “Go to house number 15,” you know exactly where to go.

A memory address is like **house number 15 for data inside the computer**.

Memory Partitioning: Dividing memory into sections for different things.

Example:

Your money is separated:

- Fuel money
- Food money
- Savings money

You don't mix everything together.

A computer also divides memory into sections.

Variable: A container that stores information.

Statement: One instruction given to the computer.

Example:

"Start the bike."

That's one instruction.

Module: A ready-made collection of code that someone already wrote.

Example:

Instead of building your own motorcycle engine, you buy one that's already made.

Code: All the instructions written for the computer.

Example:

A list saying:

1. Start bike.
2. Pick passenger.
3. Go to town.
4. Collect money.

That whole list is like code.

Block of Code: A group of instructions that belong together.

Example:

Your morning routine:

1. Wake up.
2. Wash.
3. Start bike.
4. Go to stage

Data Type: The kind of information stored.

Example:

Different luggage:

- Money
- Passenger names
- Phone numbers

Different kinds of data.

11. Declaring

Meaning: Creating a variable and giving it a name.

Example:

You buy a new box and label it “Fuel Money.”

12. Initialising

Meaning: Putting the first value into the variable.

Example:

You now put 50,000 UGX into the “Fuel Money” box.
