

ASIGNMENT

Programming:

Programming is the art and science of writing computer language

The relationship between CPU, RAM and hard disc:

The Ram is what links or connects the CPU to the hard disc. The CPU is directly connected to the RAM while the hard disc is connected to the RAM. The Hard disc is instructions are kept whereas the RAM stores things temporarily as long as they being used by the CPU.

Memory Address:

A memory address is a unit of storage.

Memory Partitioning:

Memory partitioning is the process of creating imaginary lines on the hard disc in order to create manageable units of memory.

Variable:

A variable is a named unit of memory.

A statement:

A statement is a complete single instruction to a computer.

A module:

A module is a file containing python code. It is a self-contained section of code designed to handle a specific task.

A code:

A code is a group of statements

It is a set of rules, symbols or instructions used to represent information.

A block of code:

A block of code is related statements that perform a specific task.

Data Type:

A data type is a categorization of data examples include numeric data, string data and a set.

Declaring:

It is the process of giving a name or naming a memory space for example num1, num2 can be used as names for particular memory spaces.

Initializing:

This refers to the process of giving a value to a variable. Example if num1 = 100, the given value of the variable num1 is 100. This process of giving value is what is known as initializing. Num1 = 100
