

Assignment on explaining to a boda guy the following terms

Programming

- **Definition:** Writing a set of step-by-step instructions for a computer to follow.
- **Boda Analogy:** Giving a rider exact directions for a package delivery: *"Go to the super market, buy the items, use the bypass route, and drop them at the Nayla mosque."*

2. Relation between CPU, RAM, and Hard Disk

- **Definition:** The CPU processes tasks, RAM holds active data temporarily, and the Hard Disk stores data permanently.
- **Boda Analogy:**
 - **CPU:** you the boda rider's brain, constantly making decisions while navigating traffic.
 - **RAM:** The passenger seat; it holds who or what you are dealing with *right now* for fast movement.
 - **Hard Disk:** Your home garage; it permanently stores all your spare parts and tools until you need them.

3. Memory Address

- **Definition:** A unique identifier or location number where data is stored in a computer.
- **Boda Analogy:** The exact stage number or plot location where a customer tells you to pick them up.

4. Memory Partitioning

- **Definition:** Dividing a computer's memory into distinct sections so different programs don't interfere with each other.
- **Boda Analogy:** Drawing chalk lines at a boda stage to give every rider their own designated parking slot so bikes don't collide.

5. Variables (Memory Variable)

- **Definition:** A named storage container that holds data which can change during a program.
- **Boda Analogy:** The passenger seat of your boda. The seat itself stays the same, but the person sitting on it changes with every trip.

6. Statement

- **Definition:** A single command or instruction given to the computer to perform an action.
- **Boda Analogy:** A direct command from a passenger during a ride: *"Step on the brakes!"* or *"Turn left here."*

7. Module

- **Definition:** A separate, self-contained section of code designed to handle a specific task.
- **Boda Analogy:** A puncture repair kit. It is a complete, standalone set of tools you carry and pull out only when a tire needs fixing.

8. Code

- **Definition:** The actual written language used to create a computer program.
- **Boda Analogy:** The written traffic regulations and road signs that guide how you drive on the highway.

9. Block of Code

- **Definition:** A group of related statements grouped together to achieve a larger goal.
- **Boda Analogy:** A full trip routine: kicking the starter, engaging first gear, twisting the throttle, and braking at the destination.

10. Data Type

- **Definition:** The classification of what kind of value a variable can hold (e.g., numbers, text, true/false).
- **Boda Analogy:** The type of load you are carrying. You handle a regular passenger differently than a heavy sack of charcoal or a fragile crate of eggs.

11. Declaring

- **Definition:** Announcing to the system that a variable exists and setting up its name and data type.
- **Boda Analogy:** Telling your stage chairman: *"I have reserved this extra helmet specifically for carrying corporate customers today."*

12. Initialising

- **Definition:** Giving a variable its very first value or starting point.
- **Boda Analogy:** Putting your very first customer of the morning into that reserved seat to start your working day.
