

Simple Computer Terms Explained For Everyone

1. Programming

Programming is like giving instructions to a worker. You tell a computer step by step what to do, just like telling a bodaboda rider where to take you.

2. Relationship Between CPU, RAM and Hard Disk

The Hard Disk is the store. RAM is the working table. The CPU is the worker. The worker takes things from the store, works on them on the table, and finishes the job.

3. Memory Address

A memory address is like a house number. It helps the computer find information quickly.

4. Memory Partitioning

This is like dividing land into plots. Memory is divided into sections so information can be organized.

5. Variables

A variable is like a labeled bucket where information is kept.

6. Statement

A statement is one instruction given to a computer.

7. Module

A module is like a toolbox containing tools for a specific job.

8. Code

Code is the language used to give instructions to a computer.

9. Block of Code

A block of code is a group of instructions working together.

10. Data Type

A data type tells the computer whether information is a number, word, or another kind of value.

11. Declaring

Declaring means telling the computer you want to create a storage place.

12. Initialising

Initialising means putting the first value into that storage place.
