

PROGRAMMING LANGUAGE INTO PLAIN ENGLISH

1. **Programming;**

This is the giving a computer step by step instructions to solve problems.

2. **The relation between CPU, RAM, and hard disk;**

Hard disk is where the files live when the computer is off.

RAM stores data temporarily when the computer is on.

CPU does the actual thinking and calculating just like the human brain and hands.

3. **Memory address;**

It is like a house number for a piece of data in the RAM.

In a case, RAM is like a street of many mail boxes, each mail box has a number. If your name “jovia” is stored, the computer remembers. E.g. Jovia lives at mail box #4521. That is the memory address.

4. **Memory partitioning;**

This is the dividing of your disc into sections with labels.

5. **Memory variables;**

labeled containers on your disc.

Variable = name + container that holds changing data.

6. **A statement;**

One sentence the computer acts on. E.g. add 2+2, the computer will give the result without you asking it.

7. **A module;**

A tool or chapter in a book.

8. **A code;**

The instruction that tell a computer what to do.

9. **A block of code;**

A group of statements that belong together. Everything indented under “make the sauce “ is one block. It runs as a unit.

Data types;

The kind of thing inside the container. E.g. data type= this box only holds numbers or this box only holds texts. Stops from mixing the wrong things.

Declaring;

Saying “ i need a box, and i will name it age”.

Initializing;

putting the first thing inside the box you just declared.

NOTE: declaring = creating the box.

Initializing = putting something in the box created.
